

Inspiration & benchmarking

In banking Nordics

There will be a **complete shift** in how people interact with technology at every level - and that will be **through conversations**. It will influence everything we do from shopping, to entertainment, to music, to travel, to education - and will impact how every Enterprise business is built and run.

It will shift how whole societies communicate, and the relationship and interface that everyone has with technology - across every channel we use today, and those just around the corner.

The future isn't about automation - it's about conversations and creating and guiding the operating layer of a more intuitive, human-centered digital world.

Our future is built on *meaningful* outcomes

The boost.ai Product Strategy

Simplifying *complexity*

As the technical capabilities grow more complex, our focus must stay on simplicity - in ideas, user experience, delivery and deployment - to ensure success can truly scale.

Right level **of Control**

Control is the foundation to all future success in CAI AI - especially for Enterprises in regulated industries. As Generative AI evolves daily, we remain relentless in pushing boundaries of what trusted, controllable AI can do.

Security & **Safety first**

Every idea we bring to life starts with a simple, non-negotiable commitment: security and safety first. This is not just a technical requirement — it's the foundation of every product & every relationship we build.

Roadmap Focus Areas

Voice and multimodality

How do we deliver excellent voice and multi-modal experiences?

Agentic capabilities

How do we enable more free flowing agentic conversations with less setup required?

Platform adoption

How do we streamline customer adoption and management of an AI agent?

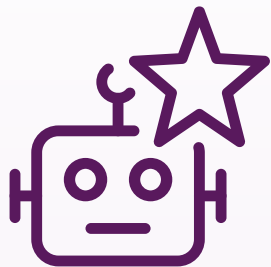

Enterprise scalability

How do we make the platform scalable for large, complex enterprises?

And how do we do all this while still providing the confidence that **regulated enterprises** expect?

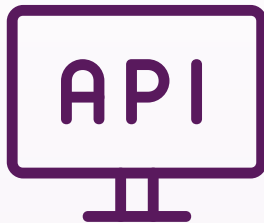

Adopting tech remains key to improve CX

Three core challenges we are helping our customers navigate

Agentic

Our customers acknowledge that CX can be enhanced with GenAI, but they want to maintain control.

Personalised CX

Personalised, transactional user journeys, where the end users are authenticated, are key to a more meaningful CX.

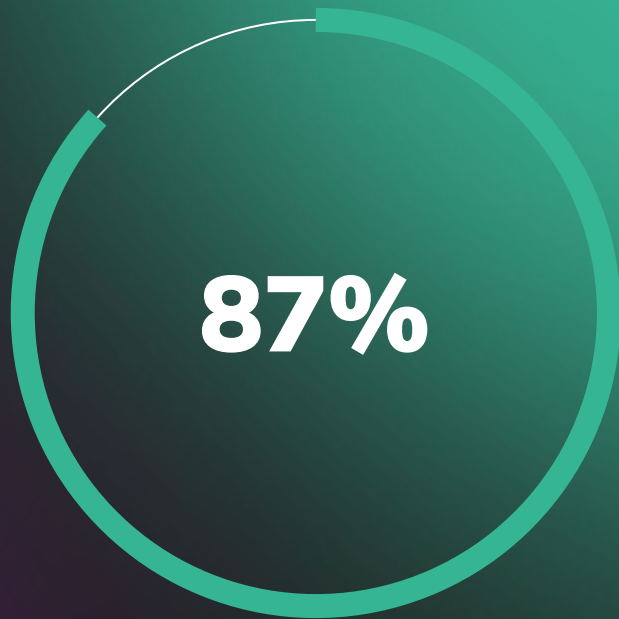

Voice

While technical aspects have previously held back Voice automation at scale, more customers are now accelerating their Voice journeys with us.

Agentic

87% of our customers have LLM features in production today, and 26% of all customer inquiries are generative

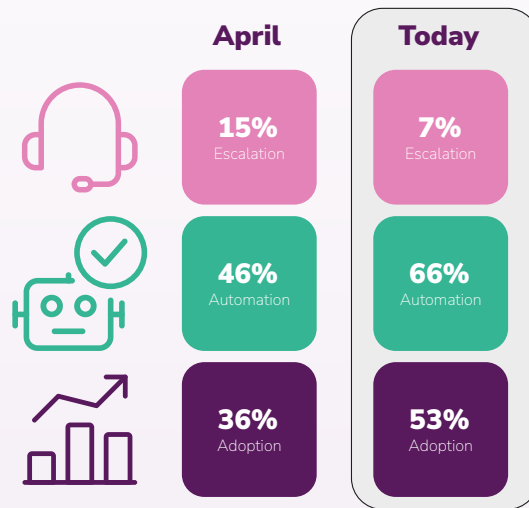

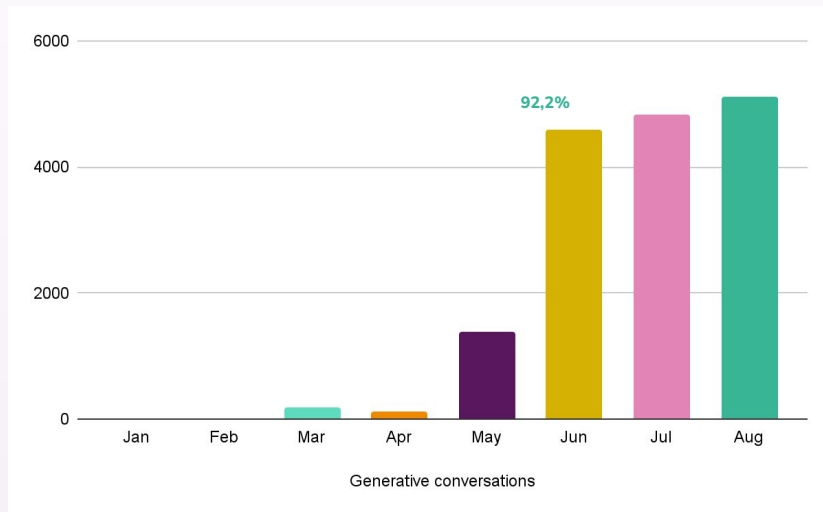

Rapid adoption of Generative AI

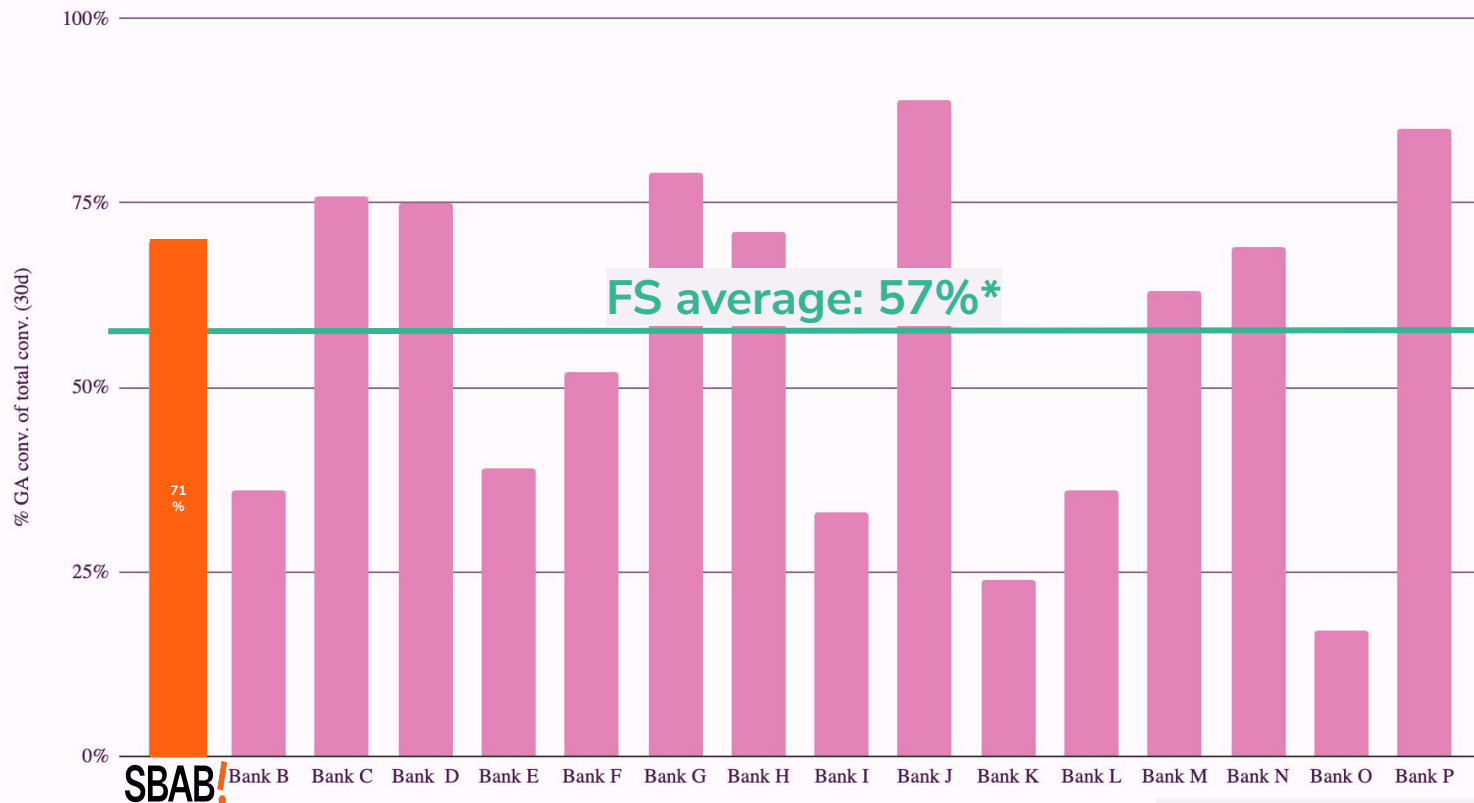

An interesting before/after success story

From low (<5%) Gen AI adoption to high (>90%) in 2 months:

1. Human handovers went from 15% to 7%.
2. Automation increased by 20 percentage points, from 46% to 66%.
3. Adoption across all channels has gradually increased from 36% to 53%.

AGENT ORCHESTRATION [BETA] (12.7 - Q1)

The foundation for scalable, agentic customer experiences

Agent Orchestration uses generative AI to dynamically route conversations to the right specialized agent based on context - not fixed rules. The Agent Orchestrator also guides the conversation between agents with built-in disambiguation and contextual understanding.

This enables more natural, scalable, and resilient customer experiences across digital channels and voice, even as conversations grow more complex.

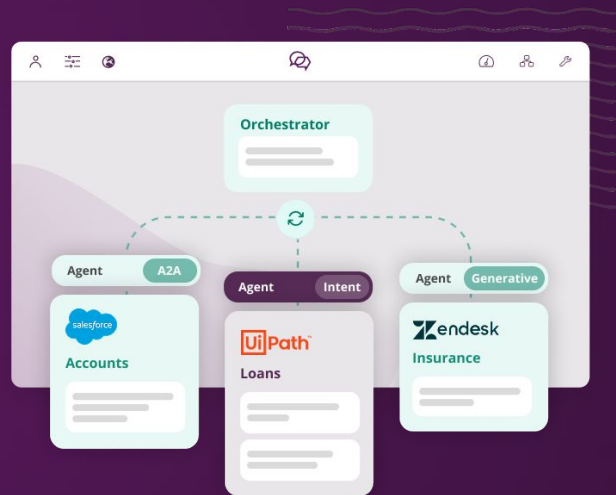

AGENT ORCHESTRATION WITH EXTERNAL A2A (Q3)

Orchestrate AI agents across platforms and vendors

Connect and coordinate external AI agents via the A2A protocol directly within the Boost platform.

This enables multi-agent collaboration across instances and vendors, allowing Boost to orchestrate complex conversations as part of a broader AI ecosystem - not just within a single platform.

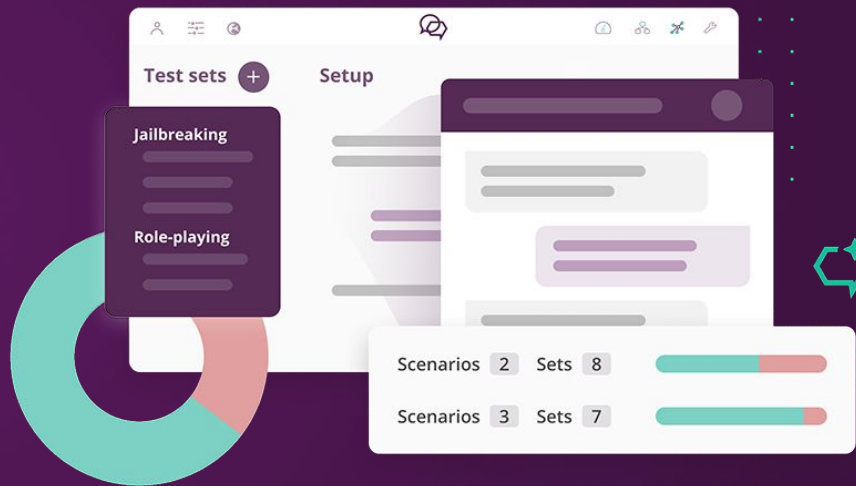

CONVERSATION TESTING V2 (Q2)

Continuously optimize knowledge for higher-quality AI Agent responses

Test end-to-end conversations - including NLU, few-shot prompts, and Orchestrator routing - at scale and over time.

Conversation Testing v2 enables teams to automatically generate, run, and track large volumes of routing and conversation tests from a single, unified Test Studio. This makes it possible to confidently validate agent behavior before and after changes, and to monitor performance as systems evolve.

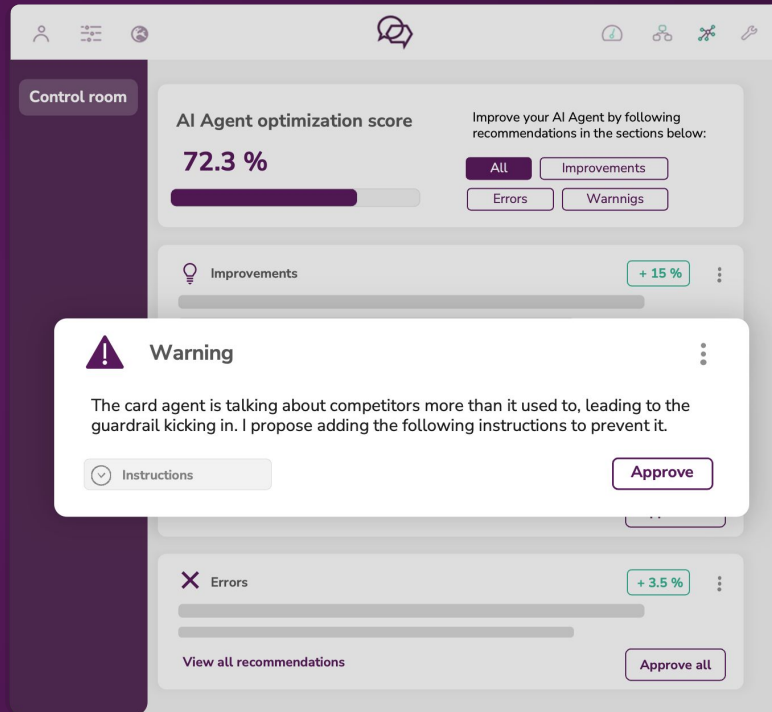

HIGH-AGENCY CONTROL ROOM (Q4)

Monitor, control, and correct agent behavior in real time

Gain real-time visibility into agentic behavior and intervene when it matters.

The High-Agency Control Room continuously monitors AI agent actions, flags potentially unwanted behavior, and recommends immediate adjustments - enabling enterprises to safely deploy agentic AI with confidence through built-in oversight and self-healing mechanisms.

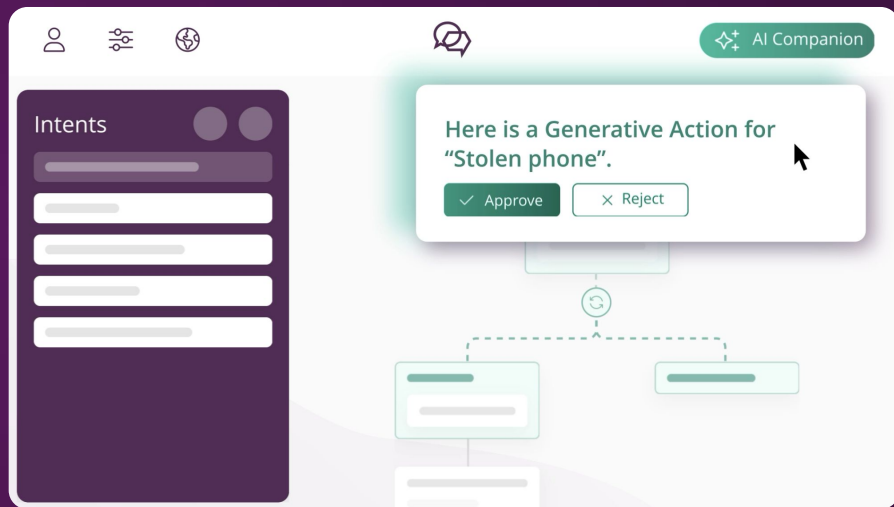

AI COMPANION FOR FLOW BUILDING (Q4)

Build and optimize conversation flows using natural language

Create, modify, and improve conversation flows by simply describing what you want to achieve.

The AI Companion for flow building lets teams build flows conversationally, apply changes instantly, and optimize tone and structure with AI-powered suggestions - reducing complexity, speeding up iteration, and making flow building accessible to more users without deep platform expertise.

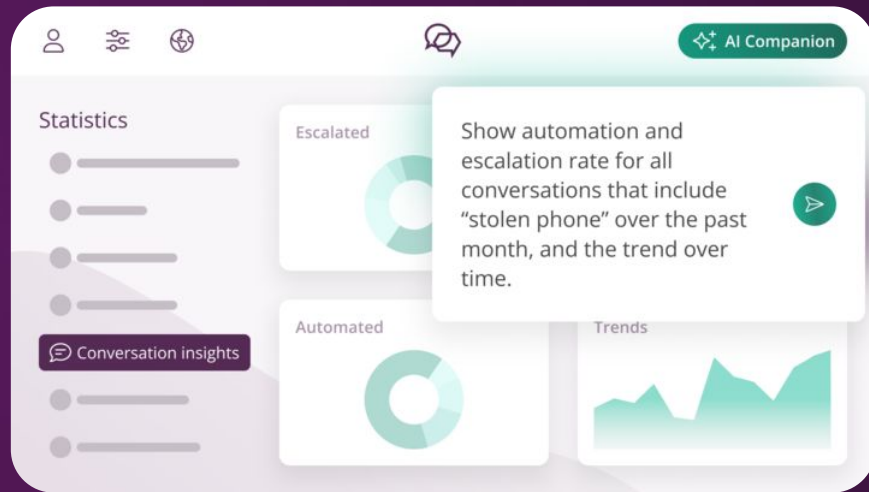

AI COMPANION FOR ANALYTICS (Q4)

Ask questions and get instant insights from your conversation data

Explore and analyze conversation data using natural language directly in the Admin Panel. The AI Companion for Analytics lets teams ask questions, generate custom metrics, and drill into results on demand - without relying on predefined dashboards, technical expertise, or data exports.

This makes advanced analytics accessible to more users and enables faster, more informed decisions.

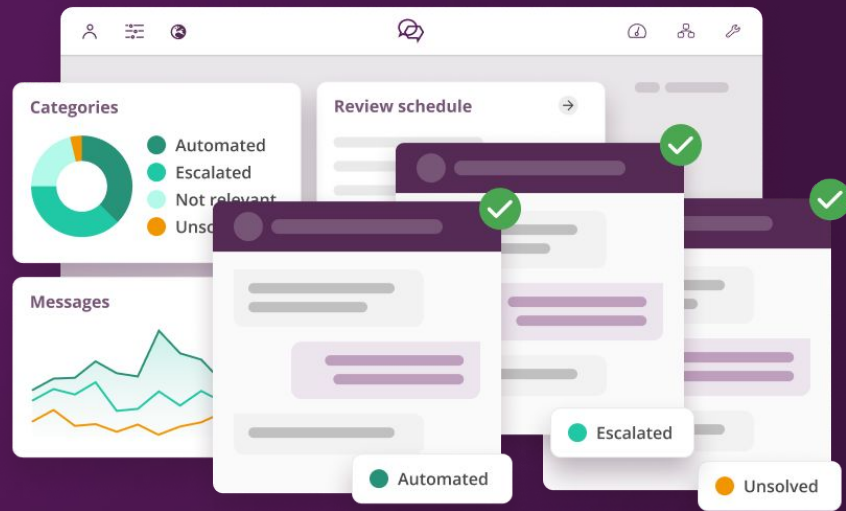

CX INSIGHTS – AI REVIEW MODEL (Q2)

More accurate AI reviews powered by a Boost-hosted model

Improve the accuracy of AI-powered conversation reviews with a Boost-hosted, fine-tuned AI Review model. Teams can manually review AI-reviewed conversations, and track discrepancies between AI and human evaluations.

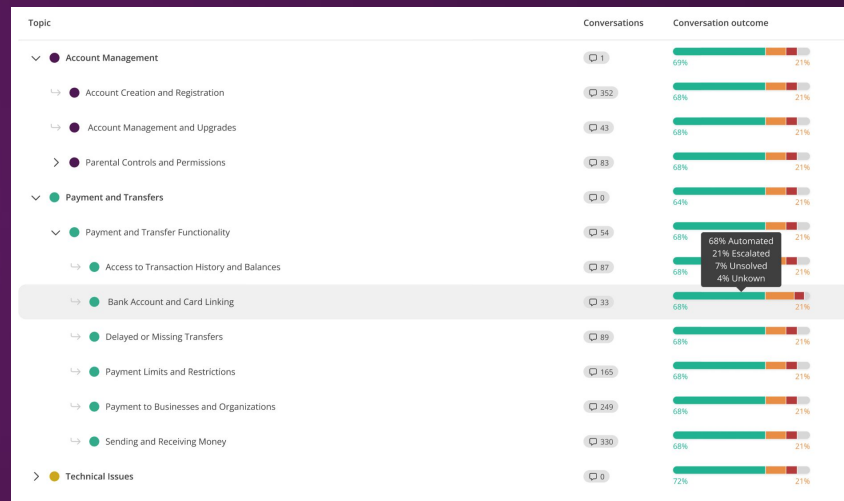

This creates a continuous feedback loop that improves review quality over time while giving teams greater visibility and control over AI-generated CX insights.

TOPIC ANALYTICS (Q2)

Topic-level insights across agentic conversations

Gain clear visibility into the topics and questions driving customer conversations, including interactions handled through Agentic Actions. Improved topic analytics shows what end users are actually asking about, giving teams actionable insight to understand demand, identify gaps, and continuously improve customer experiences as they adopt agentic AI.

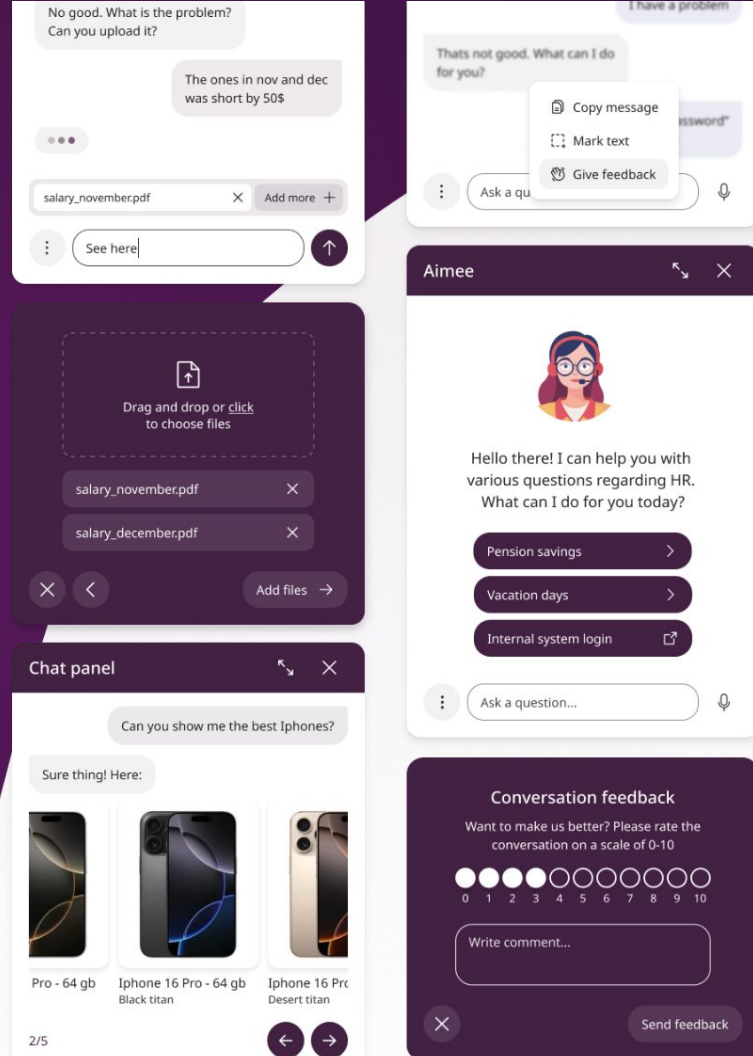

NEW CHAT PANEL WIDGET, FULL-SCREEN AND INLINE (Q3)

Chat experiences designed for agentic AI

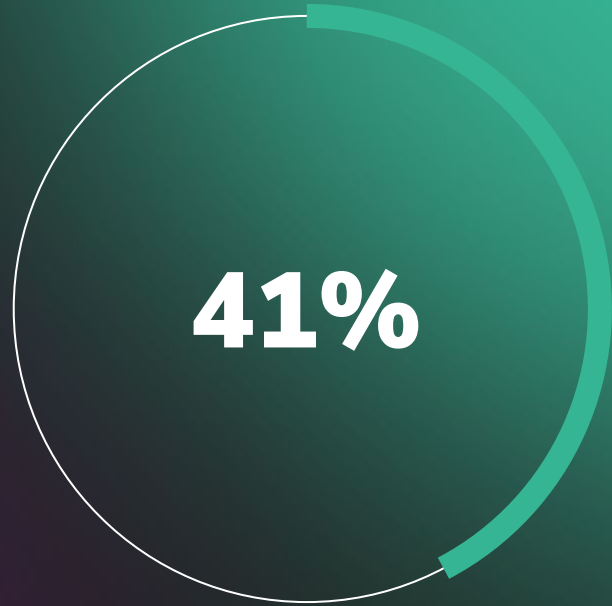

The next generation of our chat interface is designed for modern AI agents, generative responses, and asynchronous interactions.

It delivers a refreshed, flexible UI with out-of-the-box full-screen and inline options, smoother handoffs to human agents, and a new Admin Panel configuration experience that lets teams customize multiple chat panel setups without relying on frontend development.

Example

Sales leads | Proactivity

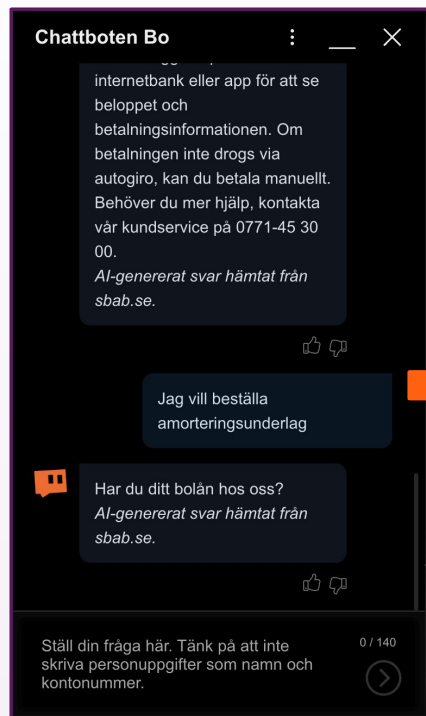

A screenshot of a chat interface. At the top left is a small icon of a robot head with a microphone. To its right is a grey message bubble containing the text: "Hi! We would like to make your housing dream easier. Can we contact you for a chat about mortgages and opportunities that suit you? No obligations, just good advice! 😊". Below the bubble are three dark blue buttons with white text and right-pointing chevrons: "Yes", "No", and "More information". At the bottom is a white input field with the placeholder text "Write here" and a grey circular button with a right-pointing chevron.

Case:

The AI Agent pops up proactively as the user browses on the company's mortgage page.

After a couple of months the bank had **10M EUR** of mortgage sales initiated by the callback.

Performance KPIs & Benchmarking

Total automation across all channels **vs. banking**

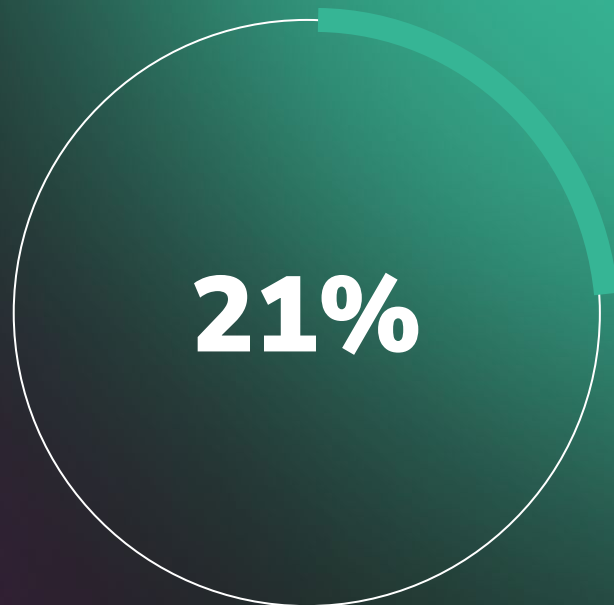

Adoption & Automation of incoming inquiries

Voice

Over the last year, our customers are automating 4-5 times more customer interactions over Voice, as tech matures significantly.

Credit Union boosts efficiency and member experience with AI Voice Agent

Challenge

This leading U.S. Credit Union wanted to enhance member experience and reduce call center load by automating common inbound inquiries—especially around identification, authentication, and account information.

Solution

Working with boost.ai, they deployed a **Voice AI Agent** that securely verifies members, provides account details like balances and routing numbers, and handles frequently asked questions—all through natural conversation.

Outcome

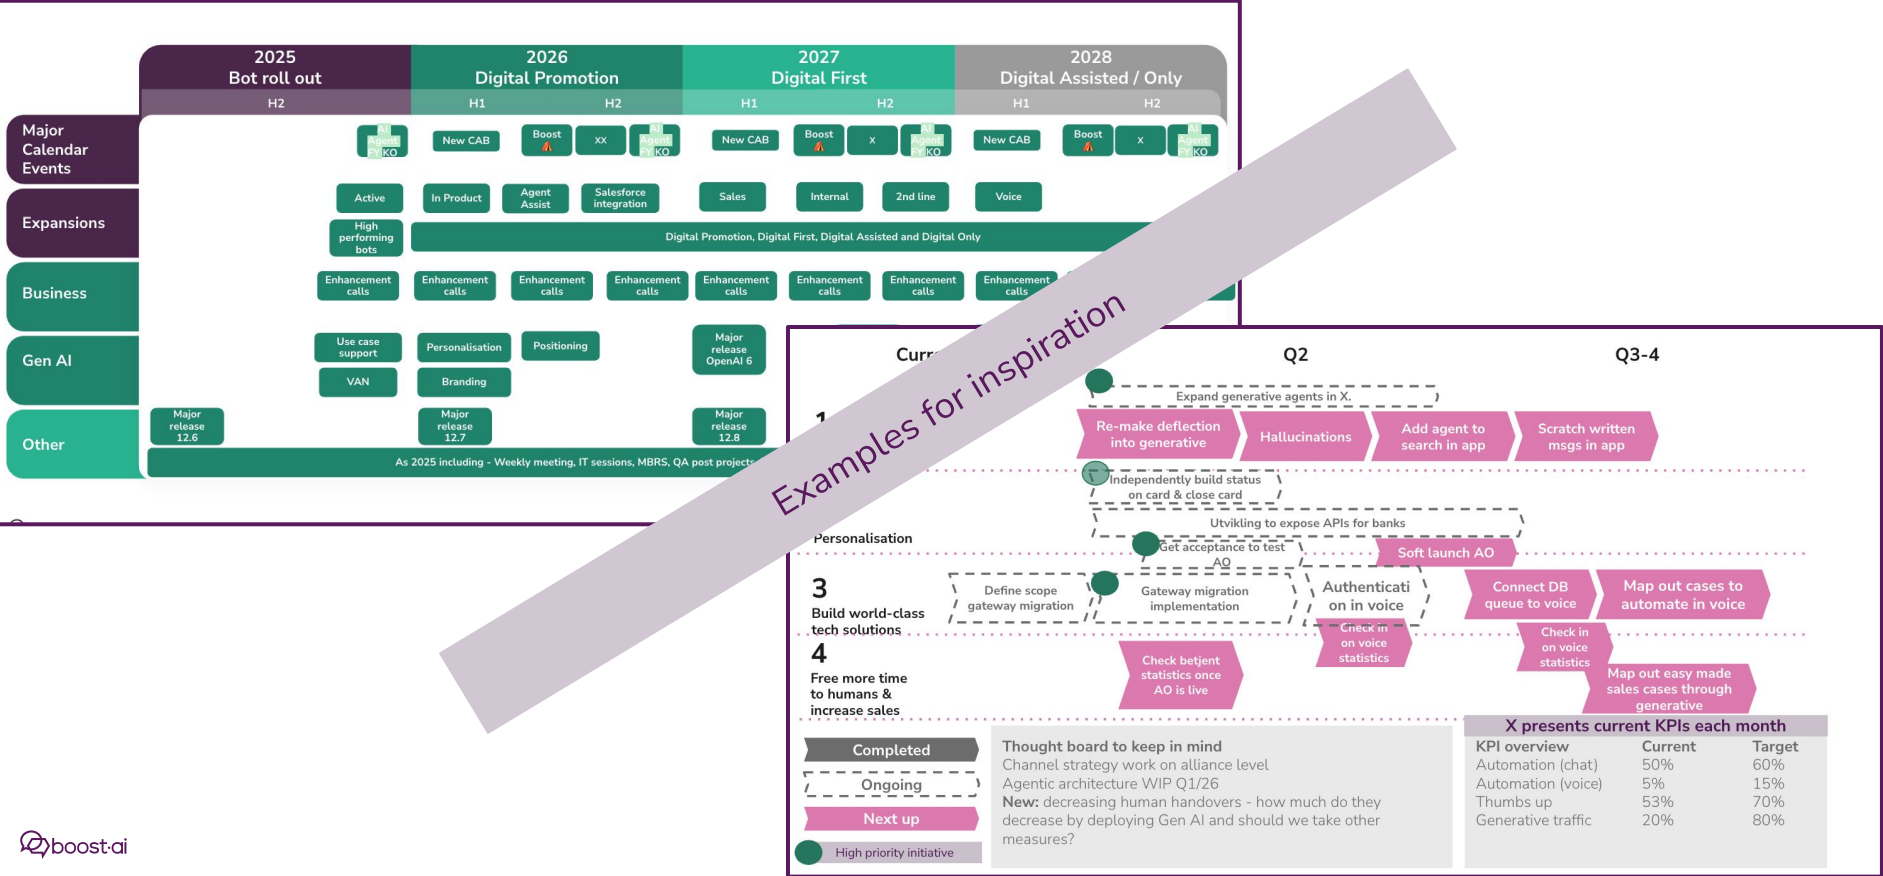

The Voice AI solution now automates 46% of all inbound calls, delivering faster service, improved member satisfaction, and freeing up agents to focus on higher-value interactions. With strong early results, the credit union is expanding automation into new use cases.

KEY METRICS

- ✓ **+1m** calls yearly
- ✓ **61%** deflection
- ✓ **46%** call automation
- ✓ **+\$3m** in cost savings
